High-speed broadband connection at home in the US

- Each person in the poll be thought of as a trial
- A person is labeled a success if s/he has high-speed broadband connection at home, failure if not
- ➤ Since 70% have high-speed broadband connection at home, probability of success is p = 0.70

Considering many scenarios

Suppose we randomly select three individuals from the US, what is the probability that exactly 1 has high-speed broadband connection at home?

Let's call these people Anthony (A), Barry (B), Cam (C). Each one of the three scenarios below will satisfy the condition of "exactly 1 of them says Yes":

The probability of exactly one 1 of 3 people saying Yes is the sum of all of these probabilities.

$$0.063 + 0.063 + 0.063 = 3 \times 0.063 = 0.189$$

.

3

The question from the prior slide asked for the probability of given number of successes, k, in a given number of trials, n, (k=1 success in n=3 trials), and we calculated this probability as

of scenarios \times P(single scenario)

- $P(single\ scenario) = p^k\ (1-p)^{(n-k)}$ probability of success to the power of number of successes, probability of failure to the power of number of failures
- \blacktriangleright number of scenarios: $\binom{n}{k} = \frac{n!}{k!(n-k)!}$

The *Binomial distribution* describes the probability of having exactly ${\bf k}$ successes in ${\bf n}$ independent trials (with only two possible outcomes) with probability of success ${\bf p}$.

4

Properties of the choose function

Clicker question

Which of the following is false?

- (a) There are n ways of getting 1 success in n trials, $\binom{n}{1} = n$.
- (b) There is only 1 way of getting n successes in n trials, $\binom{n}{n} = 1$.
- (c) There is only 1 way of getting n failures in n trials, $\binom{n}{0} = 1$.
- (d) There are n-1 ways of getting n-1 successes in n trials, $\binom{n}{n-1}=n-1$.

$$P(k \text{ successes in } n \text{ trials}) = \binom{n}{k} p^k (1-p)^{(n-k)}$$

Note: You can also use R for the calculation of number of scenarios:

> choose(5,3)

[1] 10

Clicker question

Which of the following is not a condition that needs to be met for the binomial distribution to be applicable?

- (a) the trials must be independent
- (b) the number of trials, n, must be fixed
- (c) each trial outcome must be classified as a success or a failure
- (d) the number of desired successes, ${\bf k}$, must be greater than the number of trials
- (e) the probability of success, p, must be the same for each trial

Clicker question

According to the results of the Pew poll suggesting that 70% of Americans have high-speed broadband connection at home, is the probability of exactly 2 out of 15 randomly sampled Americans having such connection at home pretty high or pretty low?

- (a) pretty high
- (b) pretty low

Clicker question

According to the results of the Pew poll 70% of Americans have high-speed broadband connection at home, what is the probability that exactly 2 out of 15 randomly sampled Americans have such connection at home?

- (a) $0.70^2 \times 0.30^{13}$
- (b) $\binom{2}{15} \times 0.70^2 \times 0.30^{13}$
- (c) $\binom{15}{2} \times 0.70^2 \times 0.30^{13}$
- (d) $\binom{15}{2} \times 0.70^{13} \times 0.30^2$

8

Expected value and standard deviation of binomial

According to the results of the Pew poll suggestion that 70% of Americans have high-speed broadband connection at home, among a random sample of 100 Americans, how many would you expect to have such connection at home?

- $Easy enough, 100 \times 0.70 = 70$
 - Or more formally, $\mu = \mathrm{np} = 100 \times 0.44 = 44$
- ▶ But this doesn't mean in every random sample of 100 Americans exactly 70 will have high-speed broadband connection at home. In some samples there will be fewer of those, and in others more. How much would we expect this value to vary?

$$\sigma = \sqrt{\text{np}(1-p)} = \sqrt{100 \times 0.70 \times 0.30} \approx 4.58$$

Note: Mean and standard deviation of a binomial might not always be whole numbers, and that is alright, these values represent what we would expect to see on average.

Shape of the binomial distribution

11

http://bitly.com/dist_calc

S-F rule: The sample size is considered large enough if the expected number of successes and failures are both at least 10

$$np \ge 10$$
 and $n(1-p) \ge 10$

10

Clicker question

Below are four pairs of Binomial distribution parameters. Which distribution's shape can be approximated by the normal distribution?

- (a) n = 25, p = 0.45
- (b) n = 100, p = 0.95
- (c) n = 150, p = 0.05
- (d) n = 500, p = 0.015

Application exercise: 2.4 Binomial distribution

See course website for details.

12

Binomial → normal

Summary of main ideas

Why do we care?

- 1. Binomial distribution is used for calculating the probability of exact number of successes for a given number of trials
- 2. Expected value and standard deviation of the binomial can be calculated using its parameters n and p
- 3. Shape of the binomial distribution approaches normal when the S-F rule is met
